all regions were double stranded or sequenced with an alternate
chemistry; an attempt was made to resolve all sequencing problems,
such as compressions and repeats; all regions were covered by
sequence from more than one subclone; and the assembly was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryotae, mitochondrial eukaryotes; Metazoa; Chordata; Vertebrata; Eutheria; Primates; Catarrhini; Hominidae; Homo. 1 (bases 1 to 38476).

FICE: This sequence may not be the entire insert of this clone. may be shorter because we only sequence overlapping sections:e, or longer because we provide a small overlap between neighboring submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest

SOURCE INFORMATION: This clone is from a chromosome x specific cosmid library LLOXACCO! 'U'. The source of the chromosomes was a human/hamster hybrid,GM0729'-F from Robert Nussbaum at University of Pennsylvania School of Medicine. Vector: Lawristi6

Clone reference:
M. Grieff, R. Mazzarella, M.P. Whyte, R.V. Thakker, R. Wilson, S. Chissoe, and D. Schlessinger. 'X-linked hypophosphatemia candidate gene region: sequence data on 80 kb containing spermine synthase and the 5' region of PEX', in preparation.

NEIGHBORING SEQUENCE INFORMATION:

The orientation of U54B12 is unknown. The start of U54B12 is at base position 1 of this sequence; the end is at base position 38476 of this sequence.

                                                                                                                                                                                                                                                                                               A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mNA by using polyf'() as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 is constructed so as to reflect accurately the relative abundance of different mRRAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. 24 A; 7 C; 14 G; 27 T;

It hybridized to all spp. of mycobacteria tested, but cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. Introducing random point mutations into nucleic acods -
by prepn of single stranded template, annealing a primer, elongation,
misincorporation, completion of molecules and screening.
Disclosure; p; English.

Bischown point mutations were introduced into the alpha fragment of
E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to
the operate a popn of DNR molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of 30130nucleotide probe MK14-A consists of nucleotides 5-95 of 302135). It hybridized to all spp. of mycobacterial seted, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. Sequence 91 BP; 5 A; 17 C; 15 G; 4 T;

reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Tentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins or screening a recombinant vector library expressing fusion proteins of screening a recombinant vector library expressing fusion proteins of screening a binding domain and an effector domain or bisclosure; page 35; 255pp; English.

Oldsfolus a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)16(TGC)(NNB)16(TGC)(NNB)16(TGC)(NNB)16(TGC)(NNB)16(TGC)(NNB)16(TGC)(NNB)16(TGC)(NNB)17. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q10466-68.

Other specified further. Other generic sequences are shown in RS151-54. TSARs are concatenated by these generic sequences are shown in RS151-54. TSARs are concatenated between generic sequences are shown in RS151-54. TSARs are concatenated between proteins or peptides.

CC Committy for a ligand and ascond effector peptide portion that is chantcally or blologically active. They may further comprise a linker peptide between the 2 domains. The oligonicleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues positioned in, or flanking, the unpredicted or variant residues compens. CC compens. Compensing arrangement of conformational rigidity to the peptides. The TSARS compension replace the function of macromolecules, eg. Gelliver a chemically or blologically active molety, eg. metal ion.

CC complex methods of hybridoma formation or in vivo antibody production.

CC The TSARS are easily permedical antibodies and therefore circumvent the need for the compens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Generic DNA sequence to generate a random TSAR petide library.
GRAR: totally synthetic affinity reagent; synthetic, binding domain;
effector domain; concateneated heterofunctional protein; linker;
direct; rapid; detection; screening; treatment; generic; ss.
                                                            Generic DNA sequence to generate a random TSAR petide library.
TSAR; toctally synthetic affinity reagent; synthetic; binding domain;
effector domain; concateneated heterofunctional protein; linker;
direct; rapid; detection; screening; treatment; generic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Teachifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins or period domain and an effector domain proteins comprising a binding domain and an effector domain proteins of screening a binding domain and an effector domain proteins of screening a binding domain and an effector domain or proteins a generic DAR sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be spinted as follows: K(NNB) G(TGC) (NNB) 11 K(NNB) 14 (TGC) (NNB) 14 K(NNB) G(TGC) (NNB) G(TGC) (NNB) 14 K(NNB) G(TGC) (NNB) 14 K(NNB) G(TGC) (NNB) 14 K(NNB) G(TGC) G
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       405 CIGGAGCCGGGTCAACIGCICGGICIAIGIGCAGCIGGAGAAGGIGIGCAGGGGAAACCC 464

Identifying proteins or peptide(s) which bind a ligand - by Identifying proteins or peptide(s) which bind a ligand - by Identifying proteins a recombinant vector library expressing fusion proteins or screening a binding domain and an effector domain proteins by a comperising a binding domain and an effector domain proteins processing a binding domain and an effector domain proteins of 70466 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows:X(NNB)1(TGC)(NNB)4(NNB)4Z(NNB)4Z(NNB)8TGC)(NNB) CC represented as follows:X(NNB)1(TGC)(NNB)4Z(NNB)4Z(NNB)8TGC)(NNB) CC that are not specific peptides generated by these generate sequences are shown in R65151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding commain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also casigned so that the expressed peptide contains are also positioned in, or flanking, the unpredicted or variant residues. These positioned in, or flanking, the unpredicted or variant residues. These crompairs comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active motety, eg. metal contoural or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoms formation or in vivo antibody production.

The TSARs or are easily preserved and therefore circumvent the need for complex methods of hybridoms formation or in vivo antibody production.

The TSARs are easily propried and the forcing activity allowing attention or many and activity and also replace the function of macromolecules, eg. The TSARs are easily the production of macromolecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               direct and rapid detection in a screening process Sequence 114 BP; 0 A; 4 C; 4 G; 4 T

comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker

```
Synthetic Affinity Reagents peptides. This generate random ISAR (Totally Synthetic Affinity Reagents) peptides. This general formula can also be represented as follows: X(NNB)11(TGC)(NNB) TGC)(NNB)10Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68. Other specified further. Other generic sequences are shown in Q70466-68. Cother specified further other generic sequences are shown in G8151-54. TSARs are concatenated by these generic sequences are shown in C6151-54. TSARs are concatenated between the sequences are also are larged at least two functional regions - a binding domain with a finity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonuclectides are also designed so that the expressed peptide contains 2 or 4 systeine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compans: comprising a TSAR inding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, thurting domain can be used in vivo to conformation also replace the function of macromolecules, eg. monoclonal or polyclonal artibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody company direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2;

The sequences candom nucleotide sequences encoding ligand binding domains - identified by screening library of vectors or peptide(s) and useful for gene therapy and diagnosis

Establishments: Page 15: 224pp; English and an appetide library.

The sequences given in Ti3610-13 represent oligonucleotides which were used in the generation of the DC43 TSAR random peptide library.

The sequence of amino acids encoded by these sequences are covered by the generic sequence. All 20 naturally occurring amino acids substantially random in sequence. All 20 naturally occurring amino acids care encoded by the variable coding region. Invariant nucleotides are positioned at particular sites in these nucleotides sequences to aid the positioned at particular sites in these nucleotides equences to aid the positioned at particular sites in these nucleotides of the conditions of the synthesised oligonucleotides. The fermini of each set of the oligonucleotides, the invariant nucleotides at the 5' termini are folsen to encode pairs of invariant nucleotides at the 5' termini are folsen to encode pairs of sites for by restriction enzymes which can function in the same buffer conditions are commercially available at high specific activity, are not complementary to each other to prevent self-ligation of the synthesised double stranded oligonucleotides and which require 6 or grantlenger of cleaving within the inserted double stranded souther to prevent self-ligation of the synthesised oligonucleotides sequences. The 3' termini invariant nucleotide sequences. The 3' termini documentation to double stranded sets of nucleotides to aid in an and conversion to double stranded sets of nucleotides to aid in an and conversion to double stranded sets of nucleotides to aid in an and conversion to double stranded sets of nucleotides to aid in an acide and conversion to double stranded sets o
                                                                                                                                                                                                                                                                                                                          ö
a TSAR binding domain can be used in vivo to deliver a chemically or biologically active molety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DC43 TSAR library generating oligonucleotide #2.

Variance 3.184; scale 3.601 Mean 11.465; Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Midbrain directional cDNA library in pSPORTI. The library
was created by subtractive hybridisation using VM mRNA as
the target nucleic acid population and total cerebellar as
cDNA as the driver nucleic acid population. The clones are
/clone="spm221:25"
/clone="spm221:25"

The library was created by subtractive hybridisation using VM mRNA as the target uncleic acid population and total cerebellar ss CDNA as the driver nucleic acid population. The clones are 3 directed."

Anotes Organ: brain; Vector: pSPORT1; Mouse Ventral Midbrain directional cDNA library in pSPORT1. The library was created by subtractive hybridisation using VM mRNA as the target nucleic acid population and total cerebellar as CDNA as the driver nucleic acid population. The clones are /clone*spm221.23*
/clone*spm221.23*
/clone*lib**Mouse VM CDNA library*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /organism--brosophila melanogaster"
/forde--Organ: embryo: Vector: plasmid; Site_1: ClaI;
Site_2: PstI; mark purified from rough endoplasmic
reticulum-bound polysomes was used as a template. CDNA's
directionally cloned at HinDIII and PstI in Bluescript
SKt. Cloned into HinDIII, but the site was destroyed to
add an adapter sequence. So ClaI is now the restriction
enzyme at site I of vector. Primers - 5' universal, 3'
